Email: dsanchez@iib.unsam.edu.ar Sequences were basecalled with pired and vector was masked with crossmatch (see http://www.phrap.org). Sequences were then trimmed from both ends to remove low quality bases and masked vector.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SOURCE INFORMATION:
This clone was derived from human PAC library RPCI-4, prepared by Pieter de Jong and coworkers at http://www.chori.org using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994).
The library is from one male donor.
The clone may be obtained either from Genome Systems, Inc.
(http://www.genomesystems.com) or Research Genetics, Inc.
(http://www.resgen.com); or from Pieter de Jong.
                                                                                                                                                                                                                                                                                                                           Direct Submission

* NOTE: This is a 'working draft' sequence. It currently consists of 44 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Direct Submission

Submitted (02-MAY-2003) Wellcome Trust Sanger Institute, Hinxton, Submitted (02-MAY-2003) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 1584, UK. E-mail enquiries: the cambridgeshire, CB10 1584, UK. E-mail enquiries: the cambridgeshire of the conference of the compared from overlapping clones. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Ems., EMBL; Sw:, SWISSPROT; Tr., TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AL357148 85660 bp DNA linear PRI 02-MAY-2003 Human DNA sequence from clone RP11-739D18 on chromosome 10, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

```

```
together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being are used to associate primary accession numbers given in the feature table with their source databases:

Em., EMEL, Sw., SWISSROT, Tr., TERMEL, Wp., WORNMERP, Information on the WORNMERP database can be found at http://www.anger.ac.uk/Projects/C_elegans/wormpep RP23-230K20 is from the RPC1-23 Mouse BAC Library constructed by the group of Pieter de Jong.

On Nov 30, 2003 this sequence version replaced gii35209691.
Sequence from the Mouse Genome Sequencing Consortium Whole genome Shotgun may have been used to confirm this sequence. Sequence as shotgun alone has only been used where it has a phred quality of at least 30.
Center: Wellcome Sanger Institute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BX470092 95593 bp DNA linear ROD 30-NOV-2003 Mouse DNA sequence from clone RP23-230K20 on chromosome X, complete
                  http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence chas generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger Centre Chromosome 10 Mapping Group. Further information can be found at Mapping Group. Further information can be found at RPB1-739D18 is from the library RPCI-11.3 constructed by the group of Pieter de Jong. For further details see NECTOR: page 6.00 for contract of page 7.00 for the contract of Pieter de Googe Center (Prophysical Prophysical Prophysica
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data of i.e., phred quality > 30); an attempt was made to recolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YRC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mus musculus

                                                                                                                                                                                                                                                                                                                                                                                                                                    Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu
NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                      This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SOURCE INFORMATION:
The RPCI-23 BAC Library has been constructed by Kazutoyo Osegawa
and Minako Tateno in the laboratory of Pieter de Jong
(http://www.chori.org) from female C57BL/6J mouse kidney and/or
brain genomic DNA. The clone and detailed information can be
obtained from Research Genetics, Inc. (http://www.resgen.com) or
pieter de Jong and coworkers at http://www.chori.org
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is the entire insert of the clone. This clone is overlapped by AC098838 and AC104519.

Direct Submission

Submitted (12-JUN-2002) Lita Annenberg Hazen Genome Sequencing

Center, Cold Spring Harbor Laboratory, 1 Bungtown Road, Cold Spring

Harbor, NY 11724, USA

On Jun 12, 2002 this sequence version replaced gi:16973731.

This sequence was finished as follows unless otherwise noted all

regions were either double-stranded or sequenced with an alternate

chemistry or covered by high quality data (i.e., phred quality >=
30; an attempt was made to resolve all sequencing problems, such

as compressions and repeats; all regions were covered by at least

one plasmid subclone or more than one M13 subclone; and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Submitted (03-NOV-2001) Lita Annenberg Hazen Genome Sequencing Center, Cold Spring Harbor Laboratory, 1 Bungtown Road, Cold Spring Harbor, NY 11724, USA.

It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw: SWISSPROT; Tr:: TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at the PROI-23 Mouse BAC Library efform.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to confirm this sequence. Sequence data from the whole genome shotgun alone has only been used where it has a phred quality of at least 30.

It currently consists of 37 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine

Claim 1; SEQ ID NO 766; 32pp + Sequence Listing; German.

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and

```
The invention relates to a nucleic acid (I) comprising a sequence at least 18 bases in length of a segment of chemically pretreated DNA (II) of genes associated with development selected from $1 genes listed in the specification such as ACCPN, ADFN, or APIN and comprising one of $50 sequences (ABN79984-ABN80333) or their complements. The invention is useful for the diagnosis or therapy of diseases associated with care complements are lated to homeobox containing genes (HOX), like diabetes, cancer, apoptosis related diseases, syndromes associated with congenital heart disease, epilepsy, diseases related to histone deacetylation, Currarino syndrome, diseases related to histone deacetylation, Currarino girdle muscular dystrophy and dwarfism. Oligoment of the brain and limb girdle muscular dystrophy and dwarfism. Coligoment specific to each of the genes are useful for detecting the methylation state of all CPG dinuclectides within the 350 sequences or the amplification of the 350 sequences, as primer oligonuclectides for the amplification of the 350 sequences, (II) and their complements squences, (II) and complements and as oligoment probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNR9). Note: The sequence data for this parent did not form part of the primer beauth of fice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel nucleic acid useful for diagnosis and therapy of diseases associated with development genes such as diabetes, comprises a sequence of a segment of chemically pretreated DNA of genes associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    parent did not form part of the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosts and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid rheumania, Alzhaimer's disease, Alz, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid rehaman, Alzheimer Misease, Alzheimer Misease, Alzheimer Misease, Alzheimer Sporiasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine methylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Apoptosis; HIV; Bloom syndrome; cardiopathy; neurodegenerative disorder;

This invention describes a novel method for modulating androgen receptor activity or androgen receptor-mediated transactivation activity in a cell. The method involves administering a compound which causes modulation of the androgen receptors activity and the inhibition of interaction between the receptor and a protein involved in a signal interaction between the receptor and a protein involved in a signal transforming growth factor (TGF)-B and phosphatase and tensin homologues deleted on chromosome IO (PTBN) or their fragments. The compounds of the invention have cytostatic and antiproliferative activity. The obtained composition is useful for treating any disease, where uncontrolled proliferation or cellular proliferation occurs such as cancer. e.g. prostate cancer. This sequence represents the androgen receptor transactivation as signalling pathway modulator APO67844 described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic sequenced tag
            Modulating androgen receptor activity, by administering a compound that modulates receptor activity, inhibits receptor-signal transduction pathway/receptor-coactivator interaction or changes amount or receptor-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 218336 BP; 64194 A; 39437 C; 43295 G; 71406 T; 0 U; 4 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to chemically pre-treated DNA of genes associated with apoptosis. The nucleic acids are used to allocate patients for specific therapy for HIV infection, Bloom syndrome, cardiopathy, aging, neurodegenerative disorders, Herpes simplex virus infection, renal ischaemia, amyotrophic lateral sclerosis, solid tumours and cancers nucleotide sequence represents a chemically treated apoptosis gene. Even SEQ ID numbers are the complementary DNA strands to the odd SEQ ID numbers. The sequence data for this patent is not represented in the printed specification but is based on information supplied by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Androgen receptor; transactivation; modulator; Smad3; Smad4; Akt; TGF-B; signal transduction pathway; transforming growth factor-B; phosphatase; tensin; cytostatic; antiproliferative; cellular proliferation; cancer; AF067844; ds.

The invention describes a method of monitoring differential expression of cohers in a first Bacillus cells relative to expression of the genes in other accillus cells, comprising hybridisand labelled mucleic acid probes is isolated from Bacillus cells to a substrate containing array of Bacillus cells the accountaining array of Bacillus cells the accountaining array of Bacillus cells that it is a spot in the array. The method is useful for measuring the expression of a spot in the array. The method is useful for measuring the expression of a spot in a first Bacillus cell relative to expression of the same genes of in one or more second Bacillus cells. The method is useful for monitoring cenes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Monitoring changes in which Bacillus cells adapt to changes in culture conditions, in which Bacillus cells adapt to changes in culture conditions, on which Bacillus cells adapt to changes in culture conditions, on which Bacillus cells adapt to changes in culture conditions, on the paracterisation is unnecessary, when one spot on an array equals one gene or one open reading frame, since sequence information is available.

This sequence represents a genomic sequence and (GST) used in the method of the invention. Note: The sequence data for this patent did not form to the printed specification, but was obtained in electronic format cells directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to constructing (M1) a strain of diploid fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous recombination, of a promoter replacement fragment with a heterologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistence of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus and for identifying a herapetuic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, blosynthetic, transporter, transcriptional, compound catabolism, blosynthetic, transporter, transcriptional, compound injubit growth or proliferation of C. albicans cells and for treatment is included albicans gene used in the method of the invention.

Continity to inhibit growth or proliferation of C. albicans cells and for treatment clatted for this parent is not represented in the printed proved the printed in partner of the printed in the printed in partner of the printed in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; NADH dehydrogenase subunit I-10; recombinant production;

This sequence represents cDNA encoding human NADH (nicotinamide adenine dinucleotide) dehydrogenase subunit I-10. The protein has a molecular weight of 10 kD. The invention relates to NADH dehydrogenase subunit I-10 (AAAM49162), nucleic acids encoding it (ABIS5142), a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. NADH dehydrogenase subunit I-10 can be used in the treatment of a variety of diseases such as cancer and HIV (human immunodeficiency virus)
Human nicotinamide adenine dinucleotide reduced (NADH) dehydrogenase unit I-10 and encoding polynucleotide useful for treating cancer and human immunodeficiency virus.
                                                                                                          Claim 6; Page 26-27 (Disclosure); 34pp; Chinese.

đ Determining genetic and/or epigenetic parameters, useful for the classification, differentiation and/or diagnosis of prostate tumors or predisposition to prostate cancer, comprises analyzing cytosine methylation.

Claim 28; Page 310-312; 376pp; English.

The invention relates to a method of determining genetic and/or epigenetic parameters for the classification, differentiation and/or diagnosis of prostate tumours or the predisposition to prostate cancer, by analysing cytosine methylation in a sample of genomic DNA. The method comprises chemically treating unmethylated cytosine bases at the 5-position to uracil or another base, which is dissimilar to cytosine in terms of hybridization behaviour; followed by amplifying at least one fragment of the chemically pre-treated genomic DNA using sets of primer

```
oligomucleotides and a polymerase. The oligomers or probes derived from them are useful for detecting the methylation state of all CpG dinucleotides and/or single nucleotide polymorphisms (SNFs) in a chemically pre-treated genomic DNA. They are all useful for treating prostate carcinoma. This sequence represents a fragment of genomic DNA used in the method of the invention.

(EPIG-) EPIGENOMICS AG

Model F, Adorjan P; Distler J,

WPI; 2003-183991/18.

Method for characterizing, classifying and/or differentiating renal and prostate cancers, by analyzing the genetic and/or epigenetic parameters of genomic DNA, particularly by determining its cytosine methylation status.

Claim 1; Page 176-177; 211pp; English.

The invention relates to a novel method for characterising, classifying and/or differentiating renal and prostate cancer. The method comprises extracting genomic DNA from a biological sample, converting cytoshine base (by chemical treatment) that are unmethylated at the 5-position to uracil or another base, and amplifying at least one fragment of the chemically pretreated genomic DNA using sets of primer oligonuclectides and a polymerase. The method is useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms in genomic DNA, particularly for characterising, classifying and/or differentiating renal and prostate cancers. The oligomers are useful as primer oligonucleotides on prostate cancers. The oligomers are useful as primer oligonucleotides on the set of oligomer probes is useful for detecting the cytosine. The set of oligomer probes is useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms in any of the 112 chemically pretreated genomic DNA sequences. The method is also useful for identifying the tissue of origin of cancer cells. The method allows the classification, differentiation and/or diagnosis of cancer tissues using minute samples which would be inadequate for histological or cytological analysis. The present sequence represents one of the 112 DNA sequences of the invention.

                                                                                                                          ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, Alzheitsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

                                                                                                                                                                   The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid thekmenia. Alzheimer's disease, Allo, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzhaimer's disease, Alz, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
Human; immune system disease; cytosine methylation; antiasthmatic; antianemic; cytostatic; noctropic; neuroprotective; anti-HVV; anticonvulsant; ophthalmologic; antirheumatic; antiarthritic; antidiabetic; antipsoriatic; antistemmetory; cancer; eye disease; atterioscierosis; anaemia; acute myeloid leukaemia; Albeimer's disease; AlDS; epilepsy; neurofibromatosis; rheumatoid arthritis; psoriasis; bowel disease; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 13326 BP; 3317 A; 258 C; 3320 G; 6431 T; 0 U; 0 Other;

/note="Weetor: pBluescript II SK+; Site_l: EcoRI; Site_2:
Xho1; The cDNA library was constructed from floral
meristematic mRNA library was constructed from floral
meristersity. Complementary DNA was synthesized from mRNA
using a primer consisting of a poly(dT) sequence with a
XhoI restriction site. EcoRI adapters were ligated to the
blunt-ended CDNA fragments followed by XhoI digestion. The
CDNA fragments were directionally cloned into the
EcoRI-XhoI restriction site of the pBluescript vector. The
ligated CDNA fragments were transformed into DHIOB host
cells (GibcoBRL). This library was constructed in the
laboratory of Dr. Randy Shoemaker."
